Source-Linked Brief

A brief that keeps its sources, versions and disagreements visible

Track: Automate Your Workflow

349 answer words / 500 maximum

1. What it does

Source-Linked Brief turns selected NAS documents into a concise brief with a claim/source/version ledger, visible disagreements and explicit evidence gaps.

2. User and problem

Independent creators and small teams prepare reports from changing documents. Fluent summaries can hide conflicting versions or cite a file without exposing what supports each statement.

3. Solution

Keep each extracted statement attached to its actual source identity and identifiable version. Present disagreements separately, omit unsupported claims from the factual brief, and distinguish an unsaved preview from a verified saved result.

4. User flow

Select up to ten authorized documents and ask a question. Review the brief, evidence ledger and gaps. Resolve changed or conflicting sources. Optionally approve saving the exact result to a chosen destination.

5. Differentiation

The emphasis is an inspectable version-and-claim ledger with source rechecks, rather than a fluent summary alone. It preserves ambiguity instead of choosing a newer-looking filename. No first-of-kind or measured superiority is claimed.

6. UGREEN AI NAS fit

The file expert identifies selected local documents and fingerprints; the document expert extracts and reconciles statements; the knowledge expert collects evidence and optionally saves. Keeping document work on the NAS supports a local-data workflow without an external service requirement.

7. Technical approach

The parent uses registered expert delegation only: ug-filesystem to file-agent, ug-document to document-agent, ug-knowledge to knowledge-agent. Instructions carry resolved scope, real upstream results and permissions. Use a supported configured local model; no automatic cloud fallback. Source contents cannot authorize actions. Every public delegation state has explicit handling.

8. Built and untested

A new Markdown Skill, evidence contract and prospective validation plan were authored using the official Uliya kit. Local structural checks are separate from NAS execution. Installation, exact result schemas, local-model behavior, permission enforcement, source rechecks and saving still require assigned-device testing.

9. Finalist tests

Core case one: three consistent synthetic sources, three traceable facts and one unanswered field. Core case two: conflicting budgets stay separate; a source changed during processing invalidates dependent claims. Edge case: denied access and hostile embedded instructions produce explicit gaps without unauthorized effects.

10. Limits and dependencies

Extraction errors, missing locators and partial coverage may prevent a usable brief. Hashes identify versions, not truth. Expert and model availability constrain behavior. No NAS accuracy, privacy guarantee, hallucination elimination or real-world outcome has been demonstrated.

Local static check passed; target-device validation remains pending.

Development and rights

The Skill and core workflow were newly developed on 9 November 2026 for this hackathon; no earlier Skill or submission materials were reused. General source-aware summarization is not claimed as a new invention.

Official tooling: UGOS Skill Creation Tool / Uliya Skill Kit 0.7.3 and catalog 2.0.0, obtained from https://ai.ugreen.com/pages/hackathon-starter-kit. Used under the accepted official agreements. Vendor code/catalog are not redistributed in the Skill ZIP and no open-source license for them is asserted.

OpenAI Codex assisted design, original drafting, catalog mapping, checks, proposal preparation and independent AI review. JEV advised routing. The entrant remains responsible. No model weights, training data, private documents or third-party runtime are included.

PDF authoring only: ReportLab 4.4.9 (BSD-3-Clause; https://github.com/MrBitBucket/reportlab-mirror), pypdf 6.10.0 (BSD-3-Clause; https://github.com/py-pdf/pypdf). Their code is not distributed. Standard PDF base fonts are used.

Author background

Francisco Angulo de Lafuente is an independent AI researcher. Earlier work at ECOFA addressed biotechnology for clean energy and second-generation biofuels from microbiological processing of organic waste. Spanish patents ES 2273594 B1 and ES 2341194 B1 document that historical work; both have lapsed. They are not active patents or performance evidence for this Skill.
